Swash® hand gel

Good hand hygiene is considered to be the most effective way of preventing infections and the spread of bacteria (Source: CDC, 2002)

Problem

Proper hand hygiene is a major concern. In our everyday lives, germs can be easily spread via the hands, as well as via objects with which they have been in contact. Regular washing of the hands can prevent infections and the spread of bacteria, and thus help eliminate any adverse effects as a result of this. However, this is not always possible because handwashing facilities are not always on hand. In such circumstances, Swash hand gel can provide the solution.

Solution

Swash hand gel guarantees high and consistent levels of hand hygiene because hands can be disinfected at any time of the day - even when no washing facilities are available, for example, when you are travelling or on holiday. Swash disinfectant hand gel, containing 70% alcohol, is soft and refreshing on the hands. The glycerine in the gel prevents skin dehydration.

Use

The gel is applied to the palms of the hand and rubbed into the hands for 30 seconds or so - as if you were washing them - until the hands feel dry. Not only does the gel clean your hands, it also kills bacteria.

Target group

Any consumer.

Swash® hand gel

Good hand hygiene is considered to be the most effective way of preventing infections and the spread of bacteria (Source: CDC, 2002)

Product benefits

- Consistent and high levels of hand hygiene
- No soap and water necessary
